

# Earth Retaining Structures (ERS) – Selection Process

# Nicholas E. Harman

2023 Southeastern Geotechnical Engineers Conference, October 31, 2023

#### https://www.scdot.org/business/geotech.aspx

## Geotechnical Design Manual (2022) 🧲

Complete Manual 🔀

The Geotechnical Design Manual (GDM) provides uniform design practices for designers preparing geotechnical reports and contract plans for SCDOT projects.

This Manual should be used in conjunction with:

Manual by Chapter 🛃

- <u>gINT Files (incorporates Rock Coring Summary & Shelby Tube Log)</u>
- ERS and Ground Improvement Selection Matrix 🖈 🧲
- ERS Selection Matrix Example
- Reasons for Selecting Specific IRs Example 🔁
- Pile Cost-PDAvsNo-PDA
- Bridge Design Manual %
- <u>Seismic Design Specifications for Highway Bridges</u>
- Borrow Materials Database Spreadsheet
- <u>GDF-001 Bridge Load Datasheet</u> w

- <u>CPTLIQ\_v1.42 (Jan2022)</u>
- UT-22.02 CPTLIQ v.1.42 User Manual 🖄

- SPLIQ v1.42 Users Manual Nov2021 🔀
- SPLIQ version 1.43 🖈

### Geotechnical Drawings & Details

Drawings are available in Microstation DGN and PDF formats.

**Drawings & Details** 

#### Updates

<u>Geotechnical Design Bulletins</u> are issued to supplement or revise the GDM.

# **Overview**

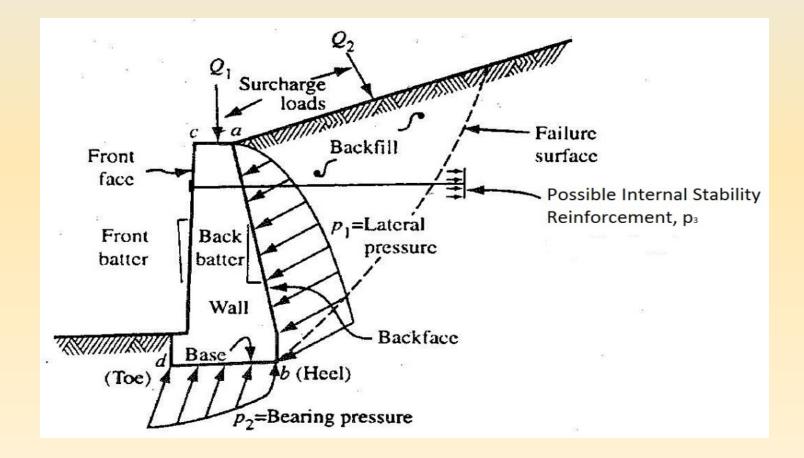

- Earth Retaining Structures (ERS) Definition
- Application
- Classification
- Selection process

#### Definition

- > Holds back earth and maintain a difference in elevations of the ground surface
- Designed to withstand forces exerted by the retained ground, and to transmit them to a foundation and or restraining elements located beyond the failure surface

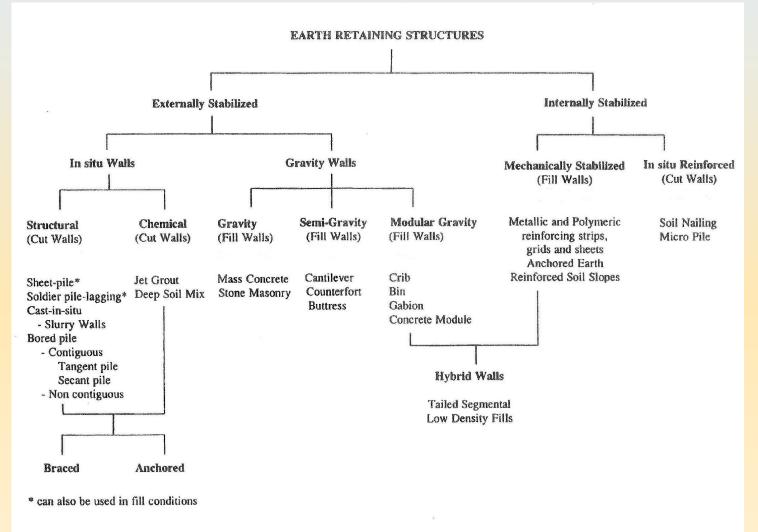

#### **Applications in highway construction**

- Highways in developed areas
- Highways at mountains or steep slopes
- Grade separations
- > Bridge abutments, wing walls and approach embankments
- Culvert walls
- > Tunnel portals and approaches
- > Cofferdams for construction of bridge foundations
- > Stabilization of slopes
- Groundwater cut-off barriers for excavations

#### **Categories of classification**

- Load Support Mechanism (externally or internally stabilized)
- Construction Concept (cut or fill)
- System Rigidity (rigid or flexible)
- Service Life (permanent or temporary)

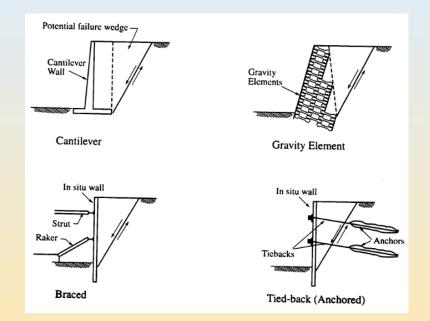

#### Load Support Mechanism

#### **Externally stabilized**

ERSs use an external structure to resist the imposed loads

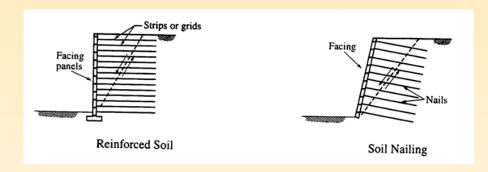

- Face units are the structural support

#### **Internally stabilized**

ERSs use an reinforcements installed within the soil mass to resist the imposed loads

- Reinforcement added to the wall system to increase wall heights
- Reinforcement is the structural support, face elements alone could not resist imposed loads

#### **Construction Concept**

**<u>Fill</u>** construction is from base to the top of the ERS (<u>**bottom-up**</u> construction)

- MSE Wall
- Gravity Wall

<u>**Cut</u>** construction is from the top to the base of the ERS (<u>top-down</u> construction)</u>

- Soil Nail
- Soldier Pile and Lagging
- Sheet Pile

### System Rigidity

### <u>Rigid</u>

- ERS moves as a unit Rigid body rotation and/or translation
- Does not experience flexural deformations

### **Flexible**

- ERS undergoes not only rigid body movements, but experiences flexural deformations as well
- Deformations allowed for redistribution of lateral pressures

#### Service Life

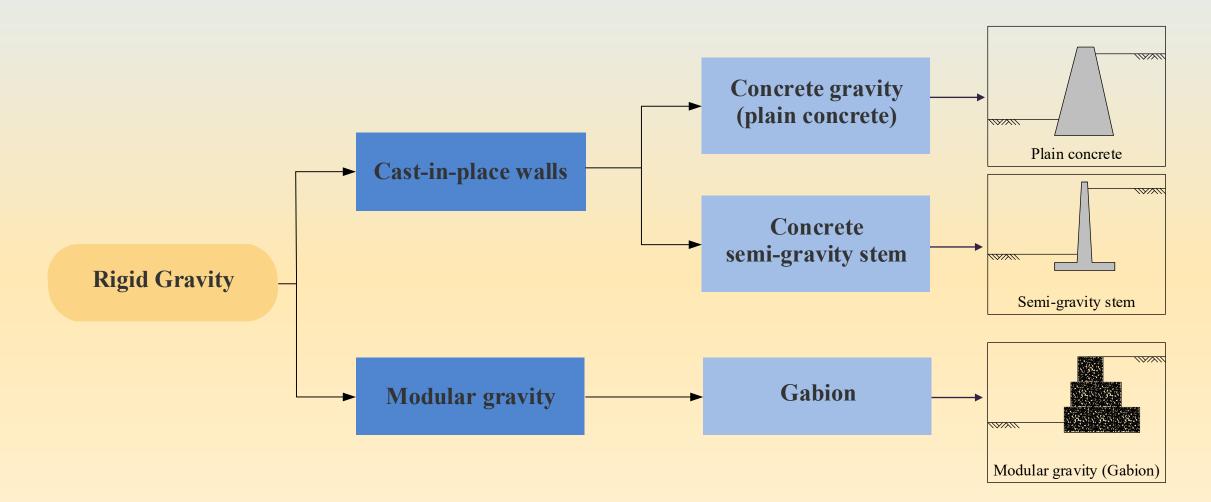

**<u>Permanent</u>** designed for a service life of 100 years

**Temporary** designed for a service life of less than 5 years

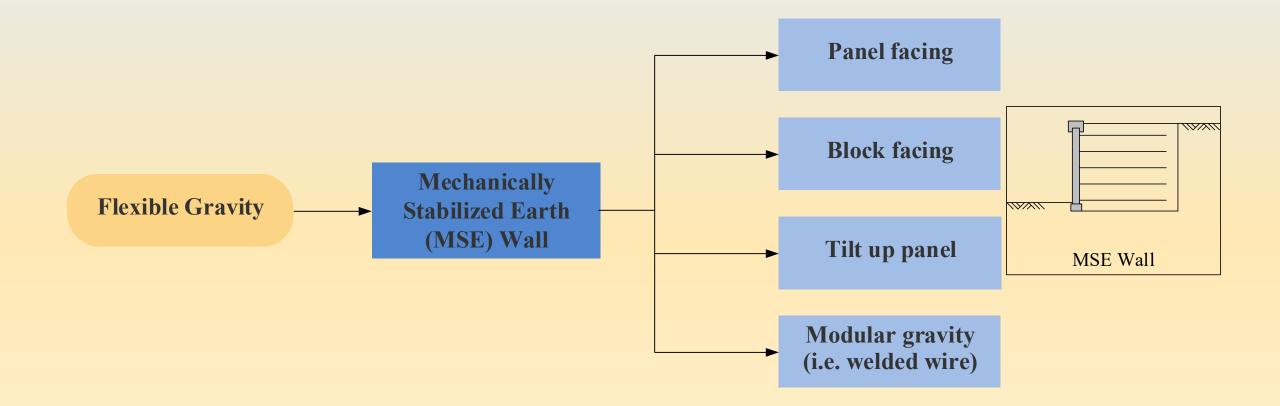

• Temporary ERSs that remain in service longer than 5 years are designed as permanent ERS

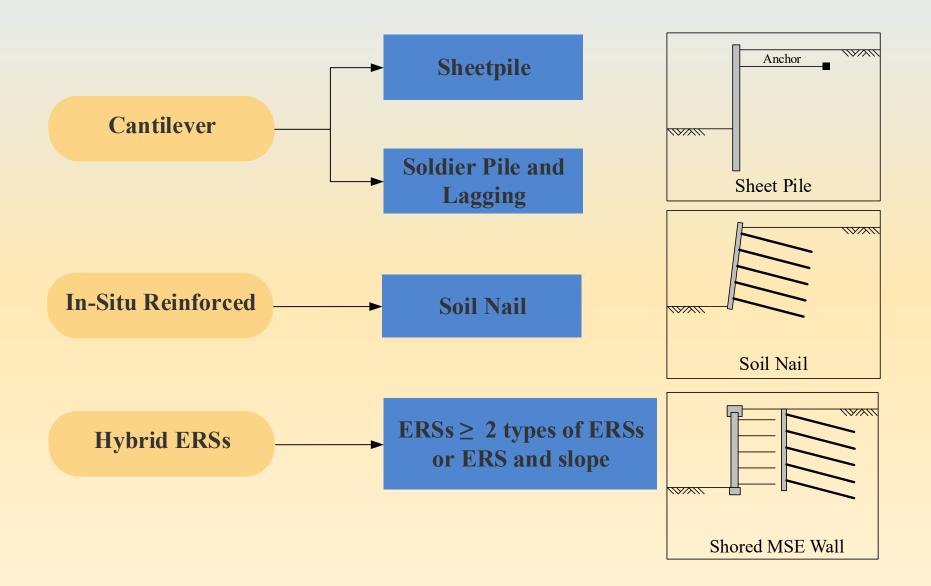

### ERS types covered by GDM

# **New ERS systems**

- Written approval from the OES/GDS is required
- Additional review times will be required

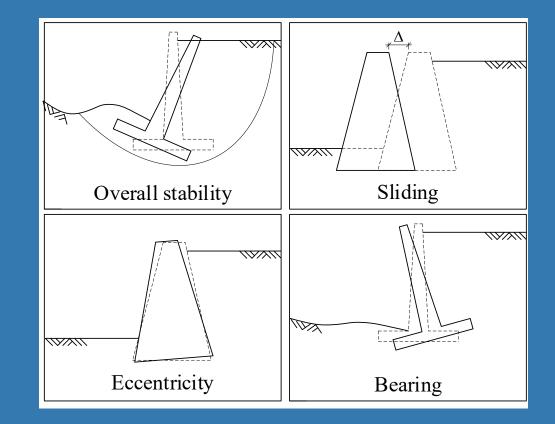

# **Design Overview**

## **External design**

- > Overall stability
- ➢ Sliding
- > Eccentricity
- > Bearing

## **Internal design**

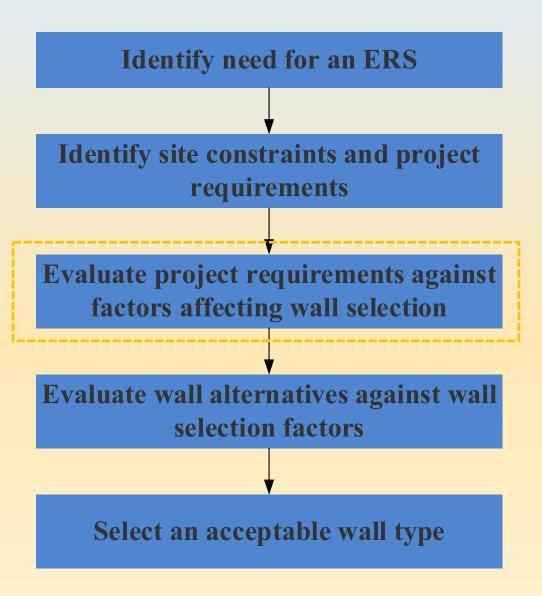

- Pullout failure of soil anchors and/or reinforcements
- > Structural component failure

## **ERS Selection Philosophy**

- The selection of the type of ERS is <u>based on</u>
  <u>numerous factors</u>
- More than <u>one ERS type may be applicable</u> for a given site
- Flowchart used for general guidance

## **Necessity for ERS**

- Should be determined by the project team
- ERSs may be **<u>required to mitigate</u>** the following conditions
  - Additional ROW cannot be obtained
  - Environmental permitting issues
  - Adjacent roadways
  - Adjacent major utilities
- One of the most important factors in determining the necessity for an ERS is making this determination <u>early in the design process</u>

### **Site Constraints and Project Requirements**

- Site accessibility and space restrictions
  - Limited ROW
  - Limited headroom
  - On-site material storage areas
  - Access for specialized construction equipment
  - Traffic disruption restrictions
- Utility locations, both above and underground
- Nearby structures
- Aesthetic requirements
- Environmental concerns
- Exposed wall face height

The **<u>design team</u>** should assess the relative importance of these items - Determine which of these items should be given priority during the selection process

# **ERS Selection**

To assist in selecting the type of ERS SCDOT uses a <u>weighted scoring</u> <u>system</u>

Importance Selection Factors (ISFs) are identified

Each ISF is assigned an Importance Rating (IR)

- 1 least important
- 3 most important

**Exception** - if the Project Development Team (PDT) determines that context sensitive design is required for a specific ERS location (i.e., aesthetics), then select the ERS type that best fits the context sensitive design

 <u>Written</u> explanation/justification is required for this selection

## **Importance Selection Factor (ISF)**

| 1 | Ground type                 | 7  | Environmental concerns               |
|---|-----------------------------|----|--------------------------------------|
| 2 | Groundwater                 | 8  | Durability and maintenance           |
| 3 | Construction considerations | 9  | Tradition                            |
| 4 | Speed of construction       | 10 | Contracting practices                |
| 5 | ROW                         | 11 | Cost                                 |
| 6 | Aesthetics                  | 12 | Displacements (lateral and vertical) |

More ISFs may be added based on the requirements of the design team

• Written explanation of the selection of additional ISFs is required

## **Weighted ERS Selection Factors**

| Earth Retaining Structure Selection Matrix |                   |             |             |                                |                          |     |            |                           |                               |           |                         |      |              |                |                |                |   |
|--|-------------------|-------------|-------------|--------------------------------|--------------------------|-----|------------|---------------------------|-------------------------------|-----------|-------------------------|------|--------------|----------------|----------------|----------------|---|
| GDM Section 18.4                           |                   |             |             |                                |                          |     |            |                           |                               |           |                         |      |              |                |                |                |   |
| SCDOT v1.1 - 03/06/2020                    |                   |             |             |                                |                          |     |            |                           |                               |           |                         |      |              |                |                |                |   |
| ISF <sup>1</sup>                           |                   | Ground Type | Groundwater | Construction<br>Considerations | Speed of<br>Construction | ROW | Aesthetics | Environmental<br>Concerns | Durability and<br>Maintenance | Tradition | Contracting<br>Practice | Cost | Displacement | X <sup>8</sup> | X <sup>8</sup> | X <sup>8</sup> | Total<br>Weighted<br>Rating<br>(WR <sub>T</sub> ) |
| ERS Type <sup>5,6</sup>                    | IR <sup>2,7</sup> | 1           | 1           | 3                              | 3                        | 1   | 3          | 1                         | 3                             | 2         | 2                       | 3    | 3            |                |                |                |   |

<sup>1</sup>Importance Selection Factor

<sup>2</sup>Importance Rating - Ranges from 1, least important, to 3, most important

<sup>3</sup>Suitability Factor - Ranges from 1, least suitable, to 4, most suitable

<sup>4</sup>Weighted Rating - Product of IR \* SF

<sup>5</sup>ERS type per Chapter 18 of latest version of GDM

<sup>6</sup>Reinforced Soil Slopes (RSS) may be used as an ERS

<sup>7</sup>GEOR to provide written justification for selection of IRs by **project team** 

<sup>8</sup>Additional ISFs may be added; however, GEOR to provide written justification

for additional ISFs as well as selection of IRs by **project team** 

## **Ground Type**

- > For the foundation soils determine
  - Bearing capacity
  - Sliding potential
  - Anticipated settlement
- Foundation soils that are anticipated to undergo large horizontal and vertical movements, may require a more flexible type wall
  - A rigid type ERS will attempt to resist the deformations which in turn will increase the stress on the structural members
  - Alternatively a temporary flexible face may be used until the deformations are completed and permanent facing may then be installed

## **Ground Type**

- Clay-like soils should not be used in fill type ERSs since these soils are difficult to compact, tend to be moisture sensitive and to undergo deformations under service loads
- Sand-like soils, especially in the Lower Coastal Plain, can be very sensitive to the effects of a seismic event
- Ground type should be considered when setting the length of bridge, since the savings from reduced bridge length can be offset by the additional cost of constructing of the ERS, especially if ground improvement is required

## Groundwater

- > SCDOT ERSs are never designed to retain water or control hydraulic forces
- Means of removing water from behind the ERS should be implemented (e.g., free-draining materials, weep holes)

> The groundwater table behind ERSs should be lowered for the following reasons:

- reduce the hydrostatic pressures on the structure
- reduce the potential for corrosion
- prevent saturation of the soil, and limit displacements
- reduce the potential for soil migration through or from the ERS

## **Construction Considerations**

### Material availability

Is it practical or economical?

### Site accessibility

Is there enough ROW to construct the ERS?

Will the ERS have to be constructed completely from the backside of the ERS?

### **Equipment availability**

Is specialized equipment required to construct the ERS?

**Labor considerations** 

Does the labor force have to have specialized training to construct the ERS?

## **Speed of Construction**

The faster the ERS can be constructed, the faster the project can be completed

## **Right-of-Way (ROW)**

The need of additional ROW should be considered in the selection of an ERS

- ERSs that support the transportation facility typically require little or no additional ROW
- ERSs that support an adjacent property owner may require either additional ROW or easement to install internally stabilizing reinforcement

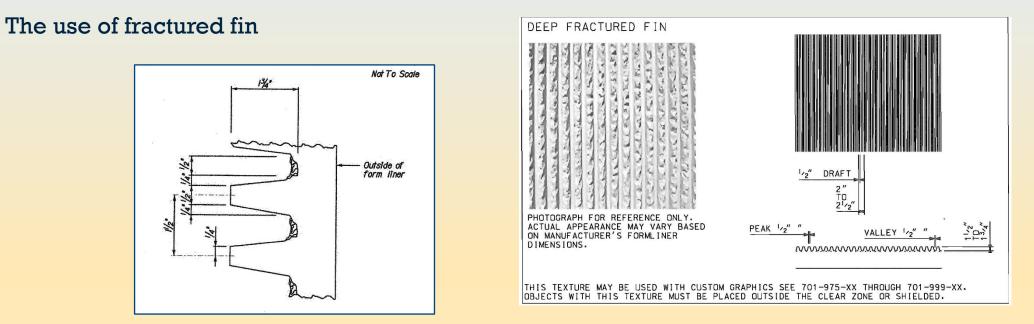

## **Aesthetics**

Aesthetics can have a significant impact on the ERS selection

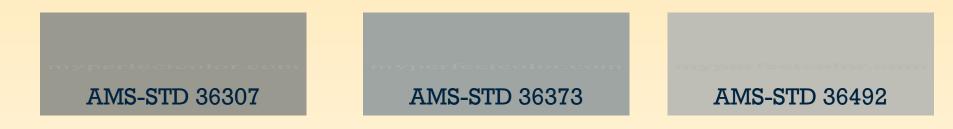

- Heavily populated area, i.e. ERS with high visibility, the ERS should be <u>aesthetically</u> <u>pleasing</u>
- Industrial location, a more industrial looking ERS could be used
- In an environmentally sensitive area, the ERS may be required to blend in with the surrounding environment

## **Aesthetics**

#### All ERSs should be a natural light gray in color

## **Environmental Concerns**

ERSs can both cause and alleviate environmental concerns

## Causes

- If contaminated material/soil must be removed prior to construction
- Noise and vibration can have a negative impact on the surrounding environment
- Hard fascia can allow for bouncing or echoing of traffic noise
- > Alleviate
  - ERSs allow for smaller footprints in environmentally sensitive areas
  - Caution should also be exercised with smaller footprints, since additional site work may be required in order for an ERS to work at a selected site

## **Durability and Maintenance**

- > The anticipated environmental conditions can affect the selection of ERS materials
- If site conditions indicate that the life of the ERS will be comprised, then a clearly defined maintenance plan should be developed and implemented
  - Include in the maintenance plan when periodic maintenance should be performed

## **Tradition**

> Tradition (i.e., what is normally done) can impact the selection of an ERS type

- Traditionally SCDOT uses:
  - MSE
  - Gravity and semi-gravity
  - Soil Nail
  - Sheetpile (cantilevered or anchored)
  - Soldier pile and lagging (cantilevered or anchored)

## **Contracting Practices**

Avoid sole source or patented ERSs if possible

Written permission is required for soil source or patented ERSs

## Cost

## Total ERS costs should include

- Structural elements
- Incidentals
- Drainage items
- Backfill materials (if required)
- ROW
  - Acquisition
  - Easement
- Excavation and disposal of unsuitable or contaminated materials
- Mitigation costs
  - Environmental impacts
  - Limit State (Extreme Event I)
- Time value of construction delays

Include any credits such as eliminating environmental permits or speeding up construction

## Displacement

Determine the amount of displacement (horizontal and vertical) that an ERS will be required to handle

Some ERS types are more flexible than others

## **Other Selection Criteria**

The Design Team, including the Project Manager, should determine if there are additional factors that need to be included

The Design Team should also determine if any of the prior ISFs should be given more weight (i.e., should aesthetics be counted twice, etc.)

## **Weighted Rating**

- > Each ISF has previously been assigned an Importance Rating (IR)
- > Each ISF is assigned a Suitability Factor (SF) for each wall type
  - SF ranges from
    - 4 most suitable
    - 1 least suitable
- > The Weighted Rating (WR) for each ISF is determined

$$IR_i * SF_i = WR_i$$

 $\succ$  The Total Weighted Rating (WR<sub>T</sub>)

$$WR_T = \sum_{i=1}^n (IR_i * SF_i) = \sum_{i=1}^n WR_i$$

- The WR<sub>T</sub> is determined using a spreadsheet available on the SCDOT website
  - <u>https://www.scdot.org/business/geotech.aspx</u>

## Weighted Rating Determination

| Earth Retaining Structure Selection Matrix<br>GDM Section 18.4 |                   |             |             |                                |                          |     |            |                           |                               |           |                         |      |              |                |                |                |  |

## Weighted Rating Determination

Once the  $WR_T$  is developed, the ERS type with the highest  $WR_T$  is the most appropriate wall type for the specific location

- Unless context sensitive design is required, then the ERS type with the highest rating that meets the context sensitive design requirement should be selected
- If context sensitive design is required, then the ERS type that meets aesthetic requirements and has a reasonably high  $WR_T$  should be selected
  - Note the use of context sensitive design should be justified in writing

## Geotechnical Design Manual (2022) 🧲

Complete Manual 🔀

The Geotechnical Design Manual (GDM) provides uniform design practices for designers preparing geotechnical reports and contract plans for SCDOT projects.

This Manual should be used in conjunction with:

Manual by Chapter 🛃

- <u>gINT Files (incorporates Rock Coring Summary & Shelby Tube Log)</u>
- ERS and Ground Improvement Selection Matrix 🖈 🧲
- ERS Selection Matrix Example
- Reasons for Selecting Specific IRs Example 🔁
- Pile Cost-PDAvsNo-PDA
- Bridge Design Manual %
- <u>Seismic Design Specifications for Highway Bridges</u>
- Borrow Materials Database Spreadsheet
- <u>GDF-001 Bridge Load Datasheet</u> w

- <u>CPTLIQ\_v1.42 (Jan2022)</u>
- UT-22.02 CPTLIQ v.1.42 User Manual 🖄

- SPLIQ v1.42 Users Manual Nov2021 🔀
- SPLIQ version 1.43 🖈

### Geotechnical Drawings & Details

Drawings are available in Microstation DGN and PDF formats.

**Drawings & Details** 

#### Updates

<u>Geotechnical Design Bulletins</u> are issued to supplement or revise the GDM.
